| $50-60$ | 2 |

The following table is formed.

| Marks | Number of <br> boys $\boldsymbol{f}_{i}$ | Cumulative <br> frequency (c.f.) | Mid- <br> point $x_{i}$ | $\mid x_{i}-$ <br> Med. $\mid$ | $f_{i} \mid x_{i}-$ <br> Med. $\mid$ |

| $50-60$ | 2 | 50 | 55 | 27.15 | 54.3 |
|  | 50 |  |  |  | 517.1 |

The class interval containing the $\left(\frac{\mathrm{N}}{2}\right)^{\text {th }}$ or $25^{\text {th }}$ item is $20-30$.
Therefore, $20-30$ is the median class.
It is known that,
Median $=l+\frac{\frac{\mathrm{N}}{2}-\mathrm{C}}{f} \times h$
Here, $l=20, \mathrm{C}=14, f=14, h=10$, and $\mathrm{N}=50$
$\therefore$ Median $=20+\frac{25-14}{14} \times 10=20+\frac{110}{14}=20+7.85=27.85$
Thus, mean deviation about the median is given by,

$$
\text { M.D. }(\mathrm{M})=\frac{1}{\mathrm{~N}} \sum_{i=1}^{6} f_{i}\left|x_{i}-\mathrm{M}\right|=\frac{1}{50} \times 517.1=10.34

The class interval containing the $\frac{\mathrm{N}^{\text {th }}}{2}$ or $50^{\mathrm{h}}$ item is $35.5-40.5$.
Therefore, $35.5-40.5$ is the median class.
It is known that,
Median $=l+\frac{\frac{\mathrm{N}}{2}-\mathrm{C}}{f} \times h$
Here, $l=35.5, \mathrm{C}=37, f=26, h=5$, and $\mathrm{N}=100$
$\therefore$ Median $=35.5+\frac{50-37}{26} \times 5=35.5+\frac{13 \times 5}{26}=35.5+2.5=38$

Thus, mean deviation about the median is given by,
M.D.(M) $=\frac{1}{\mathrm{~N}} \sum_{i=1}^{8} f_{i}\left|x_{i}-\mathrm{M}\right|=\frac{1}{100} \times 735=7.35$

From the data given below state which group is more variable, A or B?

| Group B | 10 | 20 | 30 | 25 | 43 | 15 | 7 |

Firstly, the standard deviation of group A is calculated as follows.

| Marks | Group A $\boldsymbol{f}_{\boldsymbol{i}}$ | Mid-point $\boldsymbol{x}_{\boldsymbol{i}}$ | $\mathrm{y}_{\mathrm{i}}=\frac{\mathrm{x}_{\mathrm{i}}-45}{10}$ | $\boldsymbol{y}_{\boldsymbol{i}}^{2}$ | $\boldsymbol{f}_{\boldsymbol{i}} \boldsymbol{y}_{\boldsymbol{i}}$ | $\boldsymbol{f}_{\boldsymbol{i}} \boldsymbol{y}_{\boldsymbol{i}}$ |

Here, $h=10, \mathrm{~N}=150, \mathrm{~A}=45$

$$
\begin{aligned}

$$

$\therefore$ Stan dard deviation $\left(\sigma_{1}\right)=\sqrt{227.84}=15.09$

The standard deviation of group B is calculated as follows.

| Marks | Group B <br> $\boldsymbol{f}_{\boldsymbol{i}}$ | Mid-point <br> $\boldsymbol{x}_{\boldsymbol{i}}$ | $\mathrm{y}_{\mathrm{i}}=\frac{\mathrm{x}_{\mathrm{i}}-45}{10}$ | $\boldsymbol{y}_{\boldsymbol{i}}^{2}$ | $\boldsymbol{f}_{\boldsymbol{i}} \boldsymbol{y}_{i}$ | $\boldsymbol{f}_{\boldsymbol{i}} \boldsymbol{y}_{i}^{2}$ |

$$

$$
\sigma_{2}^{2}=\frac{h^{2}}{N^{2}}\left[\mathrm{~N} \sum_{\mathrm{i}=1}^{7} \mathrm{f}_{\mathrm{i}} \mathrm{y}_{\mathrm{i}}^{2}-\left(\sum_{\mathrm{i}=1}^{7} \mathrm{f}_{\mathrm{i}} \mathrm{y}_{\mathrm{i}}\right)^{2}\right]

$$
=\frac{100}{22500}\left[150 \times 366-(-6)^{2}\right]
$$

$$

$$

$\therefore S$ tan dard deviation $\left(\sigma_{2}\right)=\sqrt{243.84}=15.61$
Since the mean of both the groups is same, the group with greater standard deviation will be more variable.

Thus, group B has more variability in the marks.

$\operatorname{Variance}\left(\sigma_{1}^{2}\right)=\frac{1}{\mathrm{~N}} \sum_{\mathrm{i}=1}^{10}(\mathrm{xi}-\overline{\mathrm{x}})^{2}=\frac{1}{10} \times 350=35$
$\therefore S$ tan dard deviation $\left(\sigma_{1}\right)=\sqrt{35}=5.91$
C.V. $($ Shares X$)=\frac{\sigma_{1}}{\mathrm{x}} \times 100=\frac{5.91}{51} \times 100=11.58$

The prices of share Y are
$108,107,105,105,106,107,104,103,104,101$
$\therefore$ Mean, $\overline{\mathrm{y}}=\frac{1}{\mathrm{~N}} \sum_{\mathrm{i}=1}^{10} \mathrm{y}_{\mathrm{i}}=\frac{1}{10} \times 1050=105$

Where You Get Complete Knowledge
The following table is obtained corresponding to shares Y.

| $y_{i}$ | $\left(y_{i}-\bar{y}\right)$ | $\left(y_{i}-\bar{y}\right)^{2}$ |
| :---: | :---: | :---: |
| 108 | 3 | 9 |
| 107 | 2 | 4 |
| 105 | 0 | 0 |
| 105 | 0 | 0 |
| 106 | 1 | 1 |
| 107 | 2 | 4 |
| 104 | -1 | 1 |
| 103 | -2 | 4 |
| 104 | -1 | 1 |
| 101 | -4 | 16 |
|  |  | 40 |

$\operatorname{Variance}\left(\sigma_{2}^{2}\right)=\frac{1}{N} \sum_{\mathrm{i}=1}^{10}\left(\mathrm{y}_{\mathrm{i}}-\overline{\mathrm{y}}\right)^{2}=\frac{1}{10} \times 40=4$
$\therefore$ Stan dard deviation $\left(\sigma_{2}\right)=\sqrt{4}=2$
$\therefore$ C.V. $($ Shares $Y)=\frac{\sigma_{2}}{\mathrm{y}} \times 100=\frac{2}{105} \times 100=1.9=11.58$
C.V. of prices of shares $X$ is greater than the C.V. of prices of shares $Y$.

Thus, the prices of shares Y are more stable than the prices of shares X .

## Question 3:

An analysis of monthly wages paid to workers in two firms A and B, belonging to the same industry, gives the following results:

Where You Get Complete Knowledge

|  | Firm A | Firm B |
| :---: | :---: | :---: |
| No. of wage earners | 586 | 648 |
| Mean of monthly wages | Rs 5253 | Rs 5253 |
| Variance of the distribution of wages | 100 | 121 |

(i) Which firm A or B pays larger amount as monthly wages?
(ii) Which firm, A or B, shows greater variability in individual wages?
(i) Monthly wages of firm A = Rs 5253

Number of wage earners in firm $\mathrm{A}=586$
$\therefore$ Total amount paid $=$ Rs $5253 \times 586$
Monthly wages of firm B = Rs 5253
Number of wage earners in firm B $=648$
$\therefore$ Total amount paid $=$ Rs $5253 \times 648$
Thus, firm B pays the larger amount as monthly wages as the number of wage earners in firm $B$ are more than the number of wage earners in firm $A$.
(ii) Variance of the distribution of wages in firm $\mathrm{A}\left(\sigma_{1}^{2}\right)=100$
$\therefore$ Standard deviation of the distribution of wages in firm
$A\left(\left(\sigma_{1}\right)=\sqrt{100}=10\right.$
Variance of the distribution of wages in firm $\mathrm{B}\left(\sigma_{2}^{2}\right)=121$
$\therefore$ Standard deviation of the distribution of wages in firm $\mathrm{B}\left(\sigma_{2}^{2}\right)=\sqrt{121}=11$
The mean of monthly wages of both the firms is same i.e., 5253. Therefore, the firm with greater standard deviation will have more variability.

Where You Get Complete Knowledge
Thus, firm B has greater variability in the individual wages.

## Question 4:

The following is the record of goals scored by team A in a football session:

| No. of goals scored | 0 | 1 | 2 | 3 | 4 |
| :---: | :---: | :---: | :---: | :---: | :---: |
| No. of matches | 1 | 9 | 7 | 5 | 3 |

For the team B, mean number of goals scored per match was 2 with a standard deviation 1.25 goals. Find which team may be considered more consistent?

The mean and the standard deviation of goals scored by team A are calculated as follows.

| No. of goals scored | No. of matches | $f_{\boldsymbol{x}} \boldsymbol{x}_{\boldsymbol{i}}$ | $\boldsymbol{x}_{\boldsymbol{i}}{ }^{2}$ | $\boldsymbol{f}_{\boldsymbol{x}_{i}}$ |
| :---: | :---: | :---: | :---: | :---: |
| 0 | 1 | 0 | 0 | 0 |
| 1 | 9 | 9 | 1 | 9 |
| 2 | 7 | 14 | 4 | 28 |
| 3 | 5 | 15 | 9 | 45 |
| 4 | 3 | 12 | 16 | 48 |
|  | 25 | 50 |  | 130 |

$$
\text { Mean }=\frac{\sum_{i=1}^{5} \mathrm{f}_{\mathrm{i}} \mathrm{x}_{\mathrm{i}}}{\sum_{\mathrm{i}=1}^{5} \mathrm{f}_{\mathrm{i}}}=\frac{50}{25}=2
$$

Thus, the mean of both the teams is same.

$$
\begin{aligned}
\sigma & =\frac{1}{\mathrm{~N}} \sqrt{\mathrm{~N} \sum \mathrm{f}_{\mathrm{i}} \mathrm{x}_{\mathrm{i}}^{2}-\left(\sum \mathrm{f}_{\mathrm{i}} \mathrm{x}_{\mathrm{i}}\right)^{2}} \\
& =\frac{1}{25} \sqrt{25 \times 130-(50)^{2}} \\
& =\frac{1}{25} \sqrt{750} \\
& =\frac{1}{25} \times 27.38 \\
& =1.09
\end{aligned}
$$

The standard deviation of team B is 1.25 goals.
The average number of goals scored by both the teams is same i.e., 2 . Therefore, the team with lower standard deviation will be more consistent.

Thus, team A is more consistent than team B.

## Question 5:

The sum and sum of squares corresponding to length $x$ (in cm ) and weight $y$
(in gm ) of 50 plant products are given below:

$$
\sum_{\mathrm{i}=1}^{50} \mathrm{x}_{\mathrm{i}}=212, \quad \sum_{\mathrm{i}=1}^{50} \mathrm{x}_{\mathrm{i}}{ }^{2}=902.8, \quad \sum_{\mathrm{i}=1}^{50} \mathrm{y}_{\mathrm{i}}=261, \quad \sum_{\mathrm{i}=1}^{50} \mathrm{y}_{\mathrm{i}}^{2}=1457.6
$$

Which is more varying, the length or weight?

$$
\sum_{\mathrm{i}=1}^{50} \mathrm{x}_{\mathrm{i}}=212, \sum_{\mathrm{i}=1}^{50} \mathrm{x}_{\mathrm{i}}{ }^{2}=902.8
$$

Here, $\mathrm{N}=50$
$\therefore$ Mean, $\quad \bar{x}=\frac{\sum_{\mathrm{i}=1}^{50} \mathrm{y}_{\mathrm{i}}}{\mathrm{N}}=\frac{212}{50}=4.24$

$\therefore \mathrm{Stan}$ dard deviation, $\sigma_{1}$ (Length $)=\sqrt{0.07}=0.26$
$\therefore$ C.V. $($ Length $)=\frac{S \tan \text { dard deviation }}{\text { Mean }} \times 100=\frac{0.26}{4.24} \times 100=6.13$

Mean, $\quad \overline{\mathrm{y}}=\frac{1}{\mathrm{~N}} \sum_{\mathrm{i}=1}^{50} \mathrm{y}_{\mathrm{i}}=\frac{1}{50} \times 261=5.22$

Where You Get Complete Knowledge
$\operatorname{Variance}\left(\sigma_{2}^{2}\right)=\frac{1}{N} \sum_{i=1}^{30}\left(y_{i}-\bar{y}\right)^{2}$

$$
=\frac{1}{50} \sum_{i=1}^{50}\left(y_{i}-5.22\right)^{2}

=\frac{1}{50}[2819.6-2724.84]
$$

$$
=\frac{1}{50} \times 94.76
$$

$$
=1.89
$$

$\therefore \mathrm{Stan}$ dard deviation, $\sigma_{2}$ ( Weight $)=\sqrt{1.89}=1.37$
$\therefore$ C.V. $($ Weight $)=\frac{\text { Stan dard deviation }}{\text { Mean }} \times 100=\frac{1.37}{5.22} \times 100=26.24$
Thus, C.V. of weights is greater than the C.V. of lengths. Therefore, weights vary more than the lengths.
