## Question 1:

In $\triangle \mathrm{ABC}$ right angled at $\mathrm{B}, \mathrm{AB}=24 \mathrm{~cm}, \mathrm{BC}=7 \mathrm{~m}$. Determine
(i) $\sin \mathrm{A}, \cos \mathrm{A}$
(ii) $\sin C, \cos C$

Applying Pythagoras theorem for $\triangle \mathrm{ABC}$, we obtain
$\mathrm{AC}^{2}=\mathrm{AB}^{2}+\mathrm{BC}^{2}$
$=(24 \mathrm{~cm})^{2}+(7 \mathrm{~cm})^{2}$
$=(576+49) \mathrm{cm}^{2}$
$=625 \mathrm{~cm}^{2}$
$\therefore \mathrm{AC}=\sqrt{625} \mathrm{~cm}=25 \mathrm{~cm}$

## Question 6:

If $\angle \mathrm{A}$ and $\angle \mathrm{B}$ are acute angles such that $\cos \mathrm{A}=\cos \mathrm{B}$, then show that
$\angle A=\angle B$.

Let us consider a triangle ABC in which $\mathrm{CD} \perp \mathrm{AB}$.

It is given that
$\cos \mathrm{A}=\cos \mathrm{B}$
$\Rightarrow \frac{\mathrm{AD}}{\mathrm{AC}}=\frac{\mathrm{BD}}{\mathrm{BC}}$
We have to prove $\angle \mathrm{A}=\angle \mathrm{B}$. To prove this, let us extend AC to P such that $\mathrm{BC}=\mathrm{CP}$.

## EDUCATION CENTRE

Where You Get Complete Knowledge

From equation (1), we obtain
$\frac{\mathrm{AD}}{\mathrm{BD}}=\frac{\mathrm{AC}}{\mathrm{BC}}$
$\Rightarrow \frac{\mathrm{AD}}{\mathrm{BD}}=\frac{\mathrm{AC}}{\mathrm{CP}} \quad$ (By construction, we have $\mathrm{BC}=\mathrm{CP}$ )

By using the converse of B.P.T,
CD||BP
$\Rightarrow \angle \mathrm{ACD}=\angle \mathrm{CPB}$ (Corresponding angles) $\ldots$ (3)
And, $\angle \mathrm{BCD}=\angle \mathrm{CBP}$ (Alternate interior angles) $\ldots$

By construction, we have $\mathrm{BC}=\mathrm{CP}$.
$\therefore \angle \mathrm{CBP}=\angle \mathrm{CPB}$ (Angle opposite to equal sides of a triangle) $\ldots$
From equations (3), (4), and (5), we obtain
$\angle A C D=\angle B C D$.

In $\triangle \mathrm{CAD}$ and $\triangle \mathrm{CBD}$,
$\angle \mathrm{ACD}=\angle \mathrm{BCD}$ [Using equation (6)]
$\angle \mathrm{CDA}=\angle \mathrm{CDB}\left[\right.$ Both $\left.90^{\circ}\right]$
Therefore, the remaining angles should be equal.

## EDUCATION CENTRE

$\therefore \angle \mathrm{CAD}=\angle \mathrm{CBD}$
$\Rightarrow \angle \mathrm{A}=\angle \mathrm{B}$

## Alternatively,

Let us consider a triangle ABC in which $\mathrm{CD} \perp \mathrm{AB}$.

It is given that,
$\cos A=\cos B$
$\Rightarrow \frac{\mathrm{AD}}{\mathrm{AC}}=\frac{\mathrm{BD}}{\mathrm{BC}}$
$\Rightarrow \frac{\mathrm{AD}}{\mathrm{BD}}=\frac{\mathrm{AC}}{\mathrm{BC}}$
Let $\frac{\mathrm{AD}}{\mathrm{BD}}=\frac{\mathrm{AC}}{\mathrm{BC}}=k$
$\Rightarrow \mathrm{AD}=k \mathrm{BD}$.

And, $\mathrm{AC}=k \mathrm{BC}$

Using Pythagoras theorem for triangles CAD and CBD, we obtain
$\mathrm{CD}^{2}=\mathrm{AC}^{2}-\mathrm{AD}^{2}$

And, $\mathrm{CD}^{2}=\mathrm{BC}^{2}-\mathrm{BD}^{2} .$.

From equations (3) and (4), we obtain

$$
\begin{aligned}
& \mathrm{AC}^{2}-\mathrm{AD}^{2}=\mathrm{BC}^{2}-\mathrm{BD}^{2} \\
& \Rightarrow(k \mathrm{BC})^{2}-(k \mathrm{BD})^{2}=\mathrm{BC}^{2}-\mathrm{BD}^{2}
\end{aligned}
$$

## EDUCATION CENTRE

Where You Get Complete Knowledge
$\Rightarrow k^{2}\left(\mathrm{BC}^{2}-\mathrm{BD}^{2}\right)=\mathrm{BC}^{2}-\mathrm{BD}^{2}$
$\Rightarrow k^{2}=1$
$\Rightarrow k=1$

Putting this value in equation (2), we obtain
$\mathrm{AC}=\mathrm{BC}$
$\Rightarrow \angle \mathrm{A}=\angle \mathrm{B}$ (Angles opposite to equal sides of a triangle)

## Question 7:

If $\cot \theta=\frac{7}{8}$, evaluate
(i) $\frac{(1+\sin \theta)(1-\sin \theta)}{(1+\cos \theta)(1-\cos \theta)}\left(\right.$ ii) $\cot ^{2} \theta$

## Question 10:

In $\triangle \mathrm{PQR}$, right angled at $\mathrm{Q}, \mathrm{PR}+\mathrm{QR}=25 \mathrm{~cm}$ and $\mathrm{PQ}=5 \mathrm{~cm}$. Determine the values of $\sin \mathrm{P}, \cos \mathrm{P}$ and $\tan \mathrm{P}$.

Given that, $\mathrm{PR}+\mathrm{QR}=25$
$P Q=5$

Let PR be $x$.

Therefore, $\mathrm{QR}=25-x$

Applying Pythagoras theorem in $\triangle \mathrm{PQR}$, we obtain
$\mathrm{PR}^{2}=\mathrm{PQ}^{2}+\mathrm{QR}^{2}$

(i) The value of $\tan \mathrm{A}$ is always less than 1 .
(ii) $\sec \mathrm{A}=\frac{12}{5}$ for some value of angle A .
(iii) $\cos \mathrm{A}$ is the abbreviation used for the cosecant of angle A .
(iv) $\cot \mathrm{A}$ is the product of $\cot$ and A
(v) $\sin \theta=\frac{4}{3}$, for some angle $\theta$

$\mathrm{BC}=10.9 k$

It can be observed that for given two sides $\mathrm{AC}=12 k$ and $\mathrm{AB}=5 k$,

BC should be such that,
$\mathrm{AC}-\mathrm{AB}<\mathrm{BC}<\mathrm{AC}+\mathrm{AB}$
$12 k-5 k<\mathrm{BC}<12 k+5 k$
$7 k<\mathrm{BC}<17 k$
However, $\mathrm{BC}=10.9 k$. Clearly, such a triangle is possible and hence, such value of $\sec \mathrm{A}$ is possible.

Hence, the given statement is true.
(iii) Abbreviation used for cosecant of angle $A$ is $\operatorname{cosec} A$. And $\cos A$ is the abbreviation used for cosine of angle A.

Hence, the given statement is false.
(iv) $\cot \mathrm{A}$ is not the product of $\cot$ and A . It is the cotangent of $\angle \mathrm{A}$.

Hence, the given statement is false.
(v) $\sin \theta=\frac{4}{3}$

We know that in a right-angled triangle,

$$
\sin \theta=\frac{\text { Side opposite to } \angle \theta}{\text { Hypotenuse }}
$$

In a right-angled triangle, hypotenuse is always greater than the remaining two sides. Therefore, such value of $\sin \theta$ is not possible.

Hence, the given statement is false

## EDUCATION CENTRE

$0^{\circ}<\mathrm{A}+\mathrm{B} \leq 90^{\circ}, \mathrm{A}>\mathrm{B}$ find A and B .

$$
\begin{align*}
& \tan (\mathrm{A}+\mathrm{B})=\sqrt{3} \\
& \Rightarrow \tan (\mathrm{~A}+\mathrm{B})=\tan 60 \\
& \Rightarrow \mathrm{~A}+\mathrm{B}=60 \ldots(1)  \tag{1}\\
& \tan (\mathrm{A}-\mathrm{B})=\frac{1}{\sqrt{3}} \\
& \Rightarrow \tan (\mathrm{~A}-\mathrm{B})=\tan 30 \\
& \Rightarrow \mathrm{~A}-\mathrm{B}=30 \ldots(2) \tag{2}
\end{align*}
$$

On adding both equations, we obtain
$2 \mathrm{~A}=90$
